

Package 3 prespecified correction-and-preservation screen

Two injected artifact families across six dataset-backbone cases; five algorithmic seeds per method and condition.

Method	Sensitivity	Clean-neighbor recovery	Preservation	Joint screen
GenoRefine	5/12	0/12	0/12	0/12
IDEC	8/12	0/12	0/12	0/12

Passing the joint screen required all prespecified components. No joint screen passed (0/24 overall); this does not support a claim of general artifact correction.
